OVERVIEW

The CITYOPT mission is to optimise energy systems in smart cities. This European project will create a set of applications and related guidelines that support efficient planning, detailed design and operation of energy systems in urban districts. The project addresses energy system optimisation in different life cycle phases. It will consider appropriate service business models, privacy and trust. This will be supported by a user-centred design approach. All stakeholders including cities’ decision makers, facility managers, and citizens will be involved throughout all phases of the project.
